

MAGNETIC CLIP UTILIZING BUILT-IN FULCRUM AND LEVERS

Abstract: A magnetic clip comprising a combined magnetic member/second firm plate unit (34) lever, and a second flexible film (27) which is wrapped around and attached to said combined magnetic member/second firm plate unit lever, and an opposing ferric armature member (22) lever, and a folded flexible attachment means (26) to which said opposing levers are adhered under said fold. The lower proximal edge of said magnetic member serves as a fulcrum (44) about which said two levers can be pivoted by the operator's fingers of only one hand which can raise or lower portions (52), (56), (54), and (58) thereby causing the leading edges of said clip to open or close as needed to secure or release said clip to or from a sheet (30). Closed life size view (84).
